## What's new: Sage 500 ERP 2016

Upgrade today and improve everyday productivity, credit card data security, business visibility, and more

### Gain control

Manage your inventory data, payment options, and everyday tasks easily.

### Save time

Increase productivity with easier identification of companies and business trends as well as simpler bank and cash account reconciliation.

### Connect your business

Get access to reliable business data and key customer information to make better decisions and manage effectively.

### Purge your stock data for better inventory management

When purging data to speed up overall processing, Sage 500 ERP 2016 creates a new transaction type, which records the quantity and associated costing information as of the purge date to improve ongoing management and analysis of inventory data. You can now utilize past records without having to maintain large transactional history files.

### Choose your credit card merchant processor

To provide your customers with a variety of payment options, you need to accept credit cards and debit cards at your store, online, or on the go. Sage 500 ERP 2016 gives you the option to both retain your current processor and take advantage of Sage Exchange, a web-based payment management system that provides real-time data across all payment types so you can make better and faster decisions.

### Save processing fees with Level 3 credit card data security

Minimizing fraud risk by providing enhanced identity verification to your processor is often one of the keys to reducing processing charges. With Sage 500 ERP 2016, you can capture the data needed for Level 3 submissions in Sales Order Processing and take advantage of the potential savings in card processing.

### Design better custom reports

You need access to reliable business data to make good decisions, manage your business effectively, and forecast with confidence. The updated Report Designer in Sage 500 ERP 2016 Intelligence Reporting gives you maximum control and flexibility over your financial report layouts. Missing accounts will be automatically detected and flagged, zero value rows can be suppressed from reports making them easier to read and to present, and you can now distribute reports with calculated values or with embedded formulas so everyone can see how calculations were made.

## Quickly identify which company you are working on

You can now assign distinct colors to each company you are working on so you can quickly identify company codes to eliminate confusion and incorrect entries.

## Easily compare data and spot key business trends

To compare or look for trends in data, you often need to scroll through numerous records. In Sage 500 ERP 2016, you can move between records more easily with the new Next and Previous buttons.

## Ensure important customer information isn't overlooked

Customer memos provide information about a customer to your employees. With Sage 500 ERP 2016, you can prioritize these customer memos to flag key information about your customers and ensure they display at the right time during key business processes.
